Phase 3: Automation using Flow Designer & Email Notification

Project Tracking Scope: Global	**Target Environment:** ServiceNow Instance
Process Layer: Automated Workflow Engine	**Execution Strategy:** Low-Code / No-Code Logic Matrix

1. Functional Design & Architecture Overview

To streamline the ticket ingestion lifecycle, enforce operational consistency, and eliminate data configuration errors by triage teams, a real-time background automation flow is introduced. When an end-user creates a support record, the form requires only the **Caller Name** and a **Short Description**. The student or staff member is not expected to manually map categorization hierarchies.

Upon record generation, the ServiceNow Flow Designer engine evaluates sub-string matches within the incoming string attributes to execute zero-touch data classification. This dynamic pipeline eliminates human configuration lag, increases service classification reliability, and ensures a clean data set for support operations.

2. Auto-Classification Structural Logical Model

Activity Layer	Target String Pattern Match	Resulting Form Field Assignment
Activity 3: Wi-Fi Classification	Short Description contains **'Wi-Fi'** OR **'Network'**	Category = **Network** Subcategory = **Wi-Fi**
Activity 4: Projector Classification	Short Description contains **'Projector'**	Category = **Hardware** Subcategory = **Projector**
Activity 5: Password Classification	Short Description contains **'Forgot password'**	Category = **Access** Subcategory = **Forgot Password**
Activity 6: Performance Classification	Short Description contains **'Slow Computer'**	Category = **Performance** Subcategory = **Slow computer**

3. Step-by-Step Step-Through Configuration Canvas

Activity 1: Instantiating the Flow Record

- Open the primary application **All Menus** panel and type Flow Designer into the context search tool.
- Under the **Process Automation** module registry, select **Flow Designer** to launch the specialized cloud editor interface.
- Locate the upper right action controls, click **New**, and choose the **Flow** option link.
- Provide the primary tracking properties: Name: Auto Classify School IT Tickets and Application: Global.
- Click the **Build Flow** block control to initialize the visual programming engine grid.

Activity 2: Execution Trigger Mapping Rules

- Select the **Record Created** execution catalyst event parameter from the trigger picker panel.
- Map the target entity framework **Table** parameter to: Incident Workflow.
- Set structural entry constraints: [Category] [is] [Empty] to safeguard against overwriting active triage maps.
- Click **Done** to lock the ingestion boundary settings.

Activity 3: Implementing Conditional Parsing & Assignments

From the primary workspace layout tree, click **Add an Action, Flow Logic, or Subflow**, and select the **Flow Logic** option to build the switch paths:

Step Route Path	Logic Constraints & Parameter Mapping Attributes
If Condition Block: Wi-Fi Assessment Path	• **Label:** SD is Wifi or Network • **Condition 1:** [Trigger->Short description] [Contains] [Wi-Fi] • **Condition 2:** [Trigger->Short description] [Contains] [Network] (Set Operator to *OR*) • **Linked Action:** Choose **Update Record** ➔ Drag Data Pill to current record. Force assignments: Category = Network and Subcategory = Wi-Fi.
Else If Condition: Hardware Assessment Path	• **Label:** SD is Projector or Hardware • **Condition:** [Trigger->Short description] [Contains] [Projector] • **Linked Action:** Choose **Update Record**. Set field targets: Category = Hardware and Subcategory = Projector.
Else If Condition: Credential Assessment Path	• **Label:** SD is Forgot password • **Condition:** [Trigger->Short description] [Contains] [Forgot password] • **Linked Action:** Choose **Update Record**. Set field targets: Category = Access and Subcategory = Forgot Password.
Else If Condition: Performance Assessment Path	• **Label:** SD is Performance • **Condition:** [Trigger->Short description] [Contains] [Slow Computer] • **Linked Action:** Choose **Update Record**. Set field targets: Category = Performance and Subcategory = Slow computer.

Activity 7: Automated Notification Dispatches & Activation

To ensure end-to-end processing verification for callers, append a communication action directly following the data update routing logic. Add a new action node below the block sequences and select **Send Email**.

Configuration Field Tag	Target Context Values / Data Pill Path Maps
To	[Trigger->Caller->Email] (Dynamic Data Pill Reference Mapping)
Subject	Your Request for the issue has been submitted.
Body	Hello, Your technical support request has been recorded. Our system has automatically cataloged your ticket and assigned it to the appropriate technical support queues for resolution.

Final Deployment Step: Review all execution steps across your canvas interface. Click the **Activate** control block situated on the top right workspace header to publish the workflow system-wide.
